Running headline: DL based breeding behaviour classification

Acknowledgements

This project was partly funded by the Australian National Environmental Science Program (NESP 4.26: Modelling shorebird migration to assess disease risk amid global change). The majority of the fieldwork underlying the geolocator datasets was financed by Marcel Klaassen (Deakin University, Australia), and we gratefully acknowledge the long-term efforts of volunteers and collaborators from the Victorian Wader Study Group (VWSG) and the Australasian Wader Studies Group (AWSG) in collecting and maintaining these data. Particularly, we thank Ken Gosbell, Clive Minton, Maureen Christie, Roz Jessop and Chris Hassell. We further thank Marcel Klaassen for his valuable comments on earlier versions of the manuscript. B.P.S. was supported by a PhD scholarship from the Deutsche Bundesstiftung Umwelt (DBU).

Data availability

The R package NestNetR including all source code, underlying Ruddy Turnstone data, and documentation is available on the project's GitHub page: <https://github.com/Bennett-Stolze/NestNetR>. An anonymous form of the repository is available: <https://anonymous.4open.science/r/NestNetR-C427>.

Conflict of interest statement

The authors declare no conflicts of interest.

Author contributions

B.S. and S.L. conceived the ideas and designed methodology; S.L. collected the data; B.S. analysed the data; B.S. led the writing of the manuscript; B.S. led the development of the R package. All authors contributed equally to the drafts and gave final approval for publication.
